What is the difference between Http:\ and Https:

Http:\ is just a language used between web servers and clients (protocol).

This means that the website is talking to your browser using the regular 'unsecure' language. In other words, it is possible for someone to "eavesdrop" on your computer's conversation with the website. If you fill out a form on the website, someone might see the information you send to that site.

Https:\ means that your computer is talking to this website in secure code. So, before entering personal information such as a credit card number, be sure it has Https.
