

Network Connection Property Settings

When using Ethernet cable connection to connect to the internet via a modem provided by a high speed service, the Settings Must be set to Obtain IP address automatically and also to Obtain DNS server address automatically in order to reach websites via browser. If your modem has all lights on showing it is working correctly but you still cannot get to a website, check the settings for the Local Area Connection Properties screen.

See below.

To reach this page, click Network connection in Control Panel once.

Click once to select Local Area Connection

On the left column click Details to expand

Now, rightclick Local Area Connection and click Properties.

Place the radio dot in both Obtain Automatically

Click OK
