Forbidden Characters For Filenames

Windows squirms uncomfortably if you try to use more than 255
letters or numbers in a filename or folder. (Earlier versions of
Windows -- and DOS -- wouldn't allow more than 8!) Windows
still won't let you use any of these forbidden characters in File names:

   " / \ : * | < > ?

The moral? Limit the names of files and folders to simple letters
or numbers with no forbidden characters between them.
