

Determine PC Upgrade Readiness Using Windows Vista Hardware Assessment

With new features that make it easier for office and mobile workers to find and use information and work collaboratively, the Windows Vista™ operating system can give organizations a competitive advantage in the marketplace. While the benefits of Windows Vista are well understood, IT professionals are now asking the next set of questions:

- How many of my existing PCs are currently ready for Windows Vista?
- How many more PCs can be upgraded to Windows Vista?
- What upgrades are required in terms of memory, hard disk and graphics cards?
- How much would it cost and how long would it take to upgrade these PCs?

To help IT professionals and consultants answer these questions, Microsoft has developed a networkwide assessment tool—Windows Vista Hardware Assessment. This tool helps organizations make informed decisions about desktop deployment and migration to Windows Vista. It makes it easier for IT professionals and consultants to quickly inventory PCs on a network and automatically generate detailed reports of their hardware and device driver compatibility, all without requiring the deployment of any software agents on the individual PCs. Windows Vista Hardware Assessment is part of a family of Solution Accelerators that are available for download at no cost.
