

Windows Mobility Center

Windows Mobility Center is a component of Microsoft Windows, introduced in premium versions of Windows Vista, which centralizes the most relevant information related to mobile computing.

The Windows Mobility Center user interface presents a series of square tiles that each contains one piece of information about a component of the system, as well as action items related to that component. The tiles that appear depend on the system. Windows Vista includes the following tiles:

- * Brightness adjustment
- * Sound adjustment / mute
- * Battery level / power scheme selection
- * Wireless network status
- * Screen orientation (portrait or landscape)
- * External displays
- * Synchronization to other machines
- * Presentation settings

Additional panes can be added by individual mobile computer manufacturers wanting to reveal functionality unique to their products.

Windows Mobility Center is located in the Control Panel, and can also be launched via the key combination Windows + X. It is inaccessible on non-mobile computers.

Windows Mobility Center is included with the Home Premium, Business, Enterprise, and Ultimate editions of Windows Vista.
